BI Project - Juuls Bikeshop

Tools Used: MySQL
Power BI (DAX, Power Query)

This is an entirely fictional course-based BI project created and documented as part of my portfolio

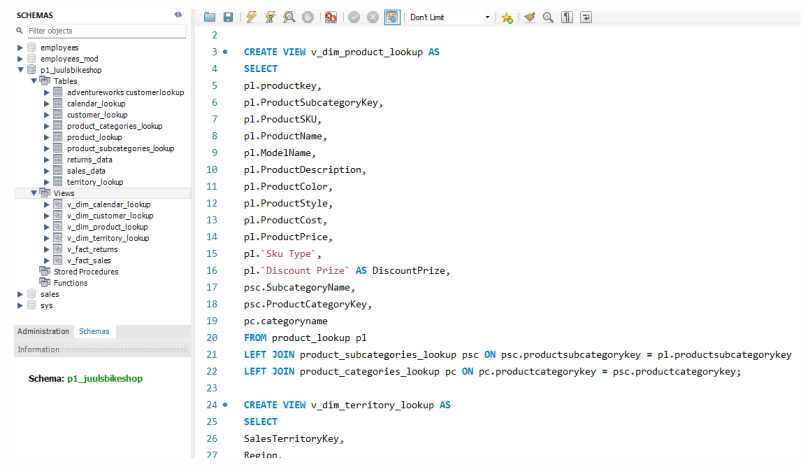
From within the company, a management request emerged for clearer business insights. In response, I developed a 4-page Power BI report for managers, including an executive dashboard, a sales map, product-level analysis, and customer-level analysis

Data Extraction

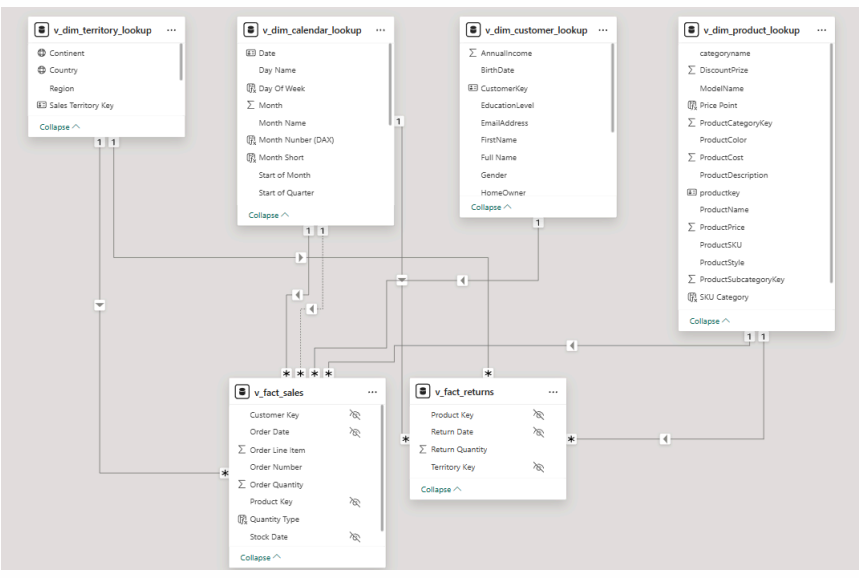
Data was imported from MySQL server

Views were created in MySQL to represent a practical star schema

data source



sql/SQLViews_Query



Project_files/JuulsBikeShop.pbix

Shaping Data & Modeling

Shaping data in Power Query, defining relationships and creating star schemas

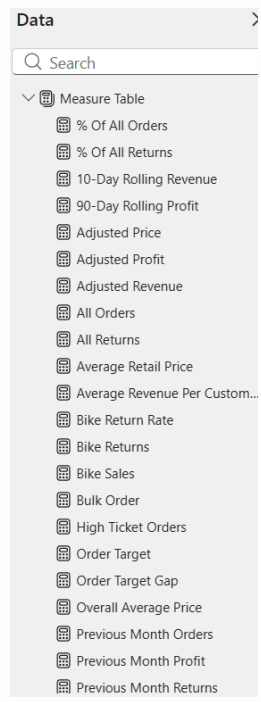
Dax Measures Development

DAX was used to create the measures needed for the visualizations and KPI analysis

```
Total Revenue =
SUMX(
    v_fact_sales,
    v_fact_sales[Order Quantity] *
    RELATED(
        v_dim_product_lookup[ProductPrice]
    )
)
```

```
Previous Month Reveneu =
CALCULATE(
    [Total Revenue],
    DATEADD(
        v_dim_calendar_lookup[Date],
        -1,
        MONTH
    )
)
```

pbix/P1_JuulsBikeShop.pbix



Dashboard Design & Visualization

The dashboards were developed based on management needs and feedback. Tooltips, page navigation, and a mobile version of the report were also added
